

AQUA 3000 Open - Managing Water Efficiently

Healthcare

Great Ormond Street Hospital for Children (NHS Foundation Trust), required 3 x AQUA 3000 Open networks across 3 of their wings.

GOSH has constantly been evolving since it first opened in 1852. Currently undergoing a redevelopment programme, the installed AQUA 3000 Open system will help significantly improve both hygiene and water efficiency through convenient central monitoring and control.

- AQUA 3000 Open Networking allows adjustments from a PC within or remote from the building to control and monitor fittings, e.g. showers, basins and clinical sinks
- Temperature sensors on hot and cold supplies – to provide statistics and help control Legionella etc.
- Fixed time hygiene purges required to suit individual patient requirements i.e. to avoid disruption overnight
- The fixed timed purge allows for a programmed sequential purge thus avoiding overflowing drains and the depletion of hot water supplies
- Thermal disinfection available for showers
- Remote lockouts from a central PC with automatic reset (manual reset option available)
- Program switching - 2 sets of parameters per fitting e.g. occupied / unoccupied or day /night etc.

Main Products Supplied:

FITTINGS LEVEL
